

Abstract Of The Disclosure

A device for detecting moving objects present in the blind spot of a vehicle, the device having at least one object detection sensor, which, when the vehicle is backed out of a parking space, detects the distance between objects moving at an angle to the vehicle and
5 sends it to an evaluation unit, and the evaluation unit determines the relative velocity from the distance sent to it, and a warning device is switched on as a function of the distance, the relative velocity and the velocity of the driver's vehicle to notify the driver of the object moving at an angle to the driver's vehicle.
